HTTP Status Lookup — Report

1. Research: HTTP 418

- **418 I'm a teapot** — the server refuses to brew coffee because it is, permanently, a teapot. An April Fools' joke from the Hyper Text Coffee Pot Control Protocol.
- Defined in **RFC 2324** (Hyper Text Coffee Pot Control Protocol, published 1 April 1998); later acknowledged in **RFC 9110** (HTTP Semantics, 2022), which reserves 418.

  - https://www.rfc-editor.org/rfc/rfc9110

2. What I built

`/workspace/app`: `index.html` + `app.js` — an HTTP status lookup page covering 10+ codes (200, 201, 204, 301, 302, 400, 401, 403, 404, 418, 429, 500, 502, 503). Served with `python3 -m http.server 8000` in the background.

3. Test result

Opened http://localhost:8000, typed 418, clicked Look up. Page showed: > **418 I'm a teapot** — The server refuses to brew coffee because it is, permanently, a teapot (RFC 2324).

The page footer reads "Built inside a gVisor box", confirming the app runs in the sealed workspace container. Screenshot: `/workspace/screenshot.png`.

4. Files

- `/workspace/report.pdf` (this report, converted)
- `/workspace/screenshot.png`
